Replacement Stowe Mast Head Unit

Important Notice

Thank you for purchasing a replacement Mast Head Unit from Stowe Marine Ltd. This unit has been designed to be more accurate and require less servicing than the original unit supplied with the equipment.

Please note that this unit requires a small amount of additional power, and it is therefore important to replace the existing fuse in your Stowe Wind Monitor or Databox from the existing 50 mA to the attached 125 mA. Please read the following applicable paragraph:

Dataline System

Open lid of Dataline box and locate fuse numbered F1. In some Databoxes this is not labelled, but it is the right hand of the two fuses. (The connectors are at the bottom of the Databox). Pull out old 50 mA fuse and fit new 125 mA fuse.

Navigator Range

If a VMG instrument is fitted then the Mast Head Unit will be powered from this instrument. If no VMG instrument is fitted then the Mast Head Unit will be powered from Wind Monitor. Note that in all cases, the Mast Head Unit will be powered by the unit that it connects directly to. Find the fuse holder on the back of the instrument that powers the Mast Head Unit and unscrew it to remove the 50 mA fuse and replace with the 125 mA fuse.

If in doubt then please email us for assistance.
